**Corning® Titan® Single-Mode Optical Fiber**

**GENERAL**

Corning® Titan® single-mode optical fiber is designed to meet increasingly demanding requirements for improved toughness. Titan fiber is more abrasion-resistant than other fibers, reducing the likelihood that the fiber can be damaged during routine handling and installation. Titan fiber also has improved fatigue resistance, so that the fiber better retains its strength over time.

This product is suitable for applications requiring single-mode fiber, including telephony, cable television, submarine and private network applications in the transmission of voice, data and/or video services.

Titan fiber features a titania-doped outer cladding that improves the abrasion and fatigue resistance of the fiber. Titan fiber's enhanced glass composition provides performance not possible with coating solutions, because the added performance doesn't get stripped off during splicing and termination.

Titan fiber is optimized for use in the 1310 nm wavelength region. With low dispersion in this operating window, fiber information-carrying capacity is at its highest. Titan fiber also can be used effectively in the 1550 nm wavelength region.

Corning fiber is protected for long-term performance and reliability by the CPC coating system. Corning's enhanced, dual acrylate CPC coatings provide excellent fiber protection and are easy to work with. CPC coatings are designed to be mechanically stripped and have an outside diameter of 245 µm. CPC coatings are optimized for use in many single and multi-fiber cable designs including loose tube, ribbon, slotted core and tight buffer cables.

Titan fiber is manufactured using the Outside Vapor Deposition (OVD) process, which produces a totally synthetic, ultra-pure fiber. As a result, Corning Titan fiber has consistent geometric properties, high strength and low attenuation. Corning Titan fiber can be counted on to deliver excellent performance and high reliability, reel after reel.

**FEATURES & BENEFITS**

- Improved abrasion and fatigue performance for long-term reliability.
- Versatility in 1310 nm and 1550 nm applications.
- Outstanding geometrical properties for low splice loss and high splice yields.
- OVD manufacturing reliability and product consistency.
- Optimized for use in loose tube, ribbon and other common cable designs.

* Lower attenuation available in limited quantities.

**Point Discontinuity**

No point discontinuity greater than 0.10 dB at either 1310 nm or 1550 nm.

**Attenuation at the Water Peak**

The attenuation at 1383±3 nm shall not exceed 2.1 dB/km.

### Dispersion Calculation

\[
\text{Dispersion} = D(\lambda) = \frac{S_0}{4} \left( \frac{\lambda^4}{\lambda_0^4} - 1 \right) \text{ps/(nm}^2\text{km)}, \quad \text{for } 1200 \text{ nm} \leq \lambda \leq 1600 \text{ nm} \quad \lambda = \text{Operating Wavelength}
\]

### Attenuation vs Wavelength

</tbody>
</table>

The attenuation in a given wavelength range does not exceed the attenuation of the reference wavelength \(\lambda\) by more than the value \(\alpha\).
